MITIGATING POTENTIAL BIAS (PROVINCIAL STROKE ROUNDS COMMITTEE)

- **The Provincial Stroke Rounds Committee mitigated bias by ensuring there was no Industry involvement in planning or education content.**

Objectives

- **To review the science behind the Canadian TIA Score**
- **To identify high risk features for subsequent stroke in patients with a new TIA/minor stroke**
- **To learn how to safely stratify TIA/minor stroke patients as low, medium or high risk for subsequent early stroke**
- **To compare the Canadian TIA Score to the ABCD2 and ABCD2i Scores to identify TIA/minor stroke patients' risk for subsequent stroke**

Case One

- **56 year old woman**
- **09:00 - Last seen well**
- **09:45 - Found with aphasia and right face, arm, leg weakness**
- **10:15: Arrival in ED, deficits resolved**
- **10:20 – You arrive to assess**

WHO Definition of Stroke / TIA

*A **clinical** syndrome
characterized by the **sudden** onset
of a **focal** neurological deficit
presumed to be on a vascular basis*

Tissue Based TIA Definition

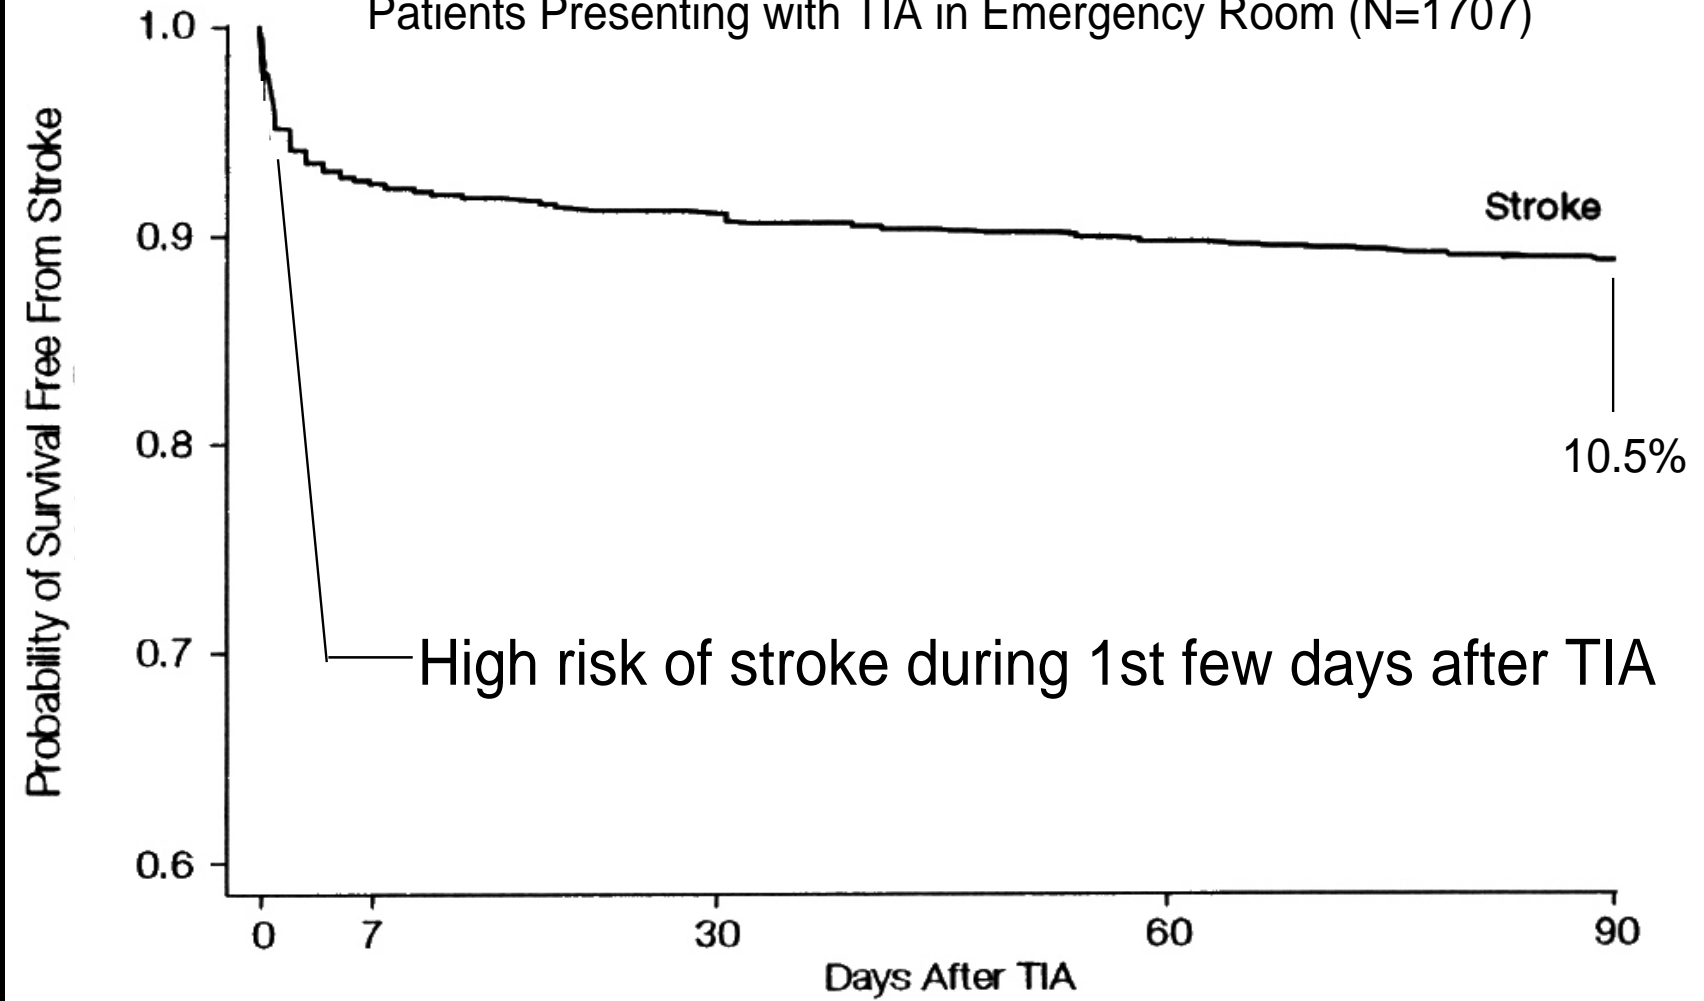

- **Brief episode (<1h) caused by focal brain or retinal ischemia without evidence of infarction**
- **Indicates risk**
- **Encourages neurodiagnostic tests**
- **Facilitates rapid intervention**

ABSTRACT

Background: The ABCD2 score (Age, Blood pressure, Clinical features, Duration of symptoms and Diabetes) is used to identify patients having a transient ischemic attack who are at high risk for imminent stroke. However, despite its widespread implementation, the ABCD2 score has not yet been prospectively validated. We assessed the accuracy of the ABCD2 score for predicting stroke at 7 (primary outcome) and 90 days.

Methods: This prospective cohort study enrolled adults from eight Canadian emergency departments who had received a diagnosis of transient ischemic attack. Physicians completed data forms with the ABCD2 score before disposition. The outcome criterion, stroke, was established by a treating neurologist or by an Adjudication Committee. We calculated the sensitivity and specificity for predicting stroke 7 and 90 days after visiting the emergency department using the original "high-risk" cutpoint of an ABCD2 score of more than 5, and the American Heart Association recommendation of a score of more than 2.

Results: We enrolled 2056 patients (mean age 68.0 yr, 1046 (50.9%) women) who had a rate of stroke of 1.8% at 7 days and 3.2% at 90 days. An ABCD2 score of more than 5 had a sensitivity of 31.6% (95% confidence interval [CI] 19.1–47.5) for stroke at 7 days and 29.2% (95% CI 19.6–41.2) for stroke at 90 days. An ABCD2 score of more than 2 resulted in sensitivity of 94.7% (95% CI 82.7–98.5) for stroke at 7 days with a specificity of 12.5% (95% CI 11.2–14.1). The accuracy of the ABCD2 score as calculated by either the enrolling physician (area under the curve 0.56; 95% CI 0.47–0.65) or the coordinating centre (area under the curve 0.65; 95% CI 0.57–0.73) was poor.

Interpretation: This multicentre prospective study involving patients in emergency departments with transient ischemic attack found the ABCD2 score to be inaccurate, at any cutpoint, as a predictor of imminent stroke. Furthermore, the ABCD2 score of more than 2 that is recommended by the American Heart Association is nonspecific.

A Prospective Cohort Study of Patients With Transient Ischemic Attack to Identify High-Risk Clinical Characteristics

Jeffrey J. Perry, MD, MSc; Mukul Sharma, MD, MSc; Marco L.A. Sivilotti, MD, MSc;
Jane Sutherland, MEd; Andrew Worster, MD, MSc; Marcel Émond, MD, MSc;

Background and Purpose—The occurrence of a transient ischemic attack (TIA) increases an individual's risk for subsequent stroke. The objectives of this study were to determine clinical features of patients with TIA associated with impending (≤ 7 days) stroke and to develop a clinical prediction score for impending stroke.

Methods—We conducted a prospective cohort study at 8 Canadian emergency departments for 5 years. We enrolled patients with a new TIA. Our outcome was subsequent stroke within 7 days of TIA diagnosis.

Results—We prospectively enrolled 3906 patients, of which 86 (2.2%) experienced a stroke within 7 days. Clinical features strongly correlated with having an impending stroke included first-ever TIA, language disturbance, longer duration, weakness, gait disturbance, elevated blood pressure, atrial fibrillation on ECG, infarction on computed tomography, and elevated blood glucose. Variables less associated with having an impending stroke included vertigo, lightheadedness, and visual loss. From this cohort, we derived the Canadian TIA Score which identifies the risk of subsequent stroke ≤ 7 days and consists of 13 variables. This model has good discrimination with a c-statistic of 0.77 (95% confidence interval, 0.73–0.82).

Conclusions—Patients with TIA with their first TIA, language disturbance, duration of symptoms ≥ 10 minutes, gait disturbance, atrial fibrillation, infarction on computed tomography, elevated platelets or glucose, unilateral weakness, history of carotid stenosis, and elevated diastolic blood pressure are at higher risk for an impending stroke. Patients with vertigo and no high-risk features are at low risk. The Canadian TIA Score quantifies the impending stroke risk following TIA. (*Stroke*. 2014;45:92-100.)

Canadian TIA Risk Score to Identify Patients with TIA at High Risk of a Subsequent Stroke or Carotid Revascularization within 7 Days

ITEMS	POINTS
Clinical Findings:	
1) First TIA (in lifetime)	2
2) Symptoms ≥ 10 minutes	2
3) Past History of Carotid Stenosis	2
4) Already on Antiplatelet Therapy	3
5) History of Gait Disturbance	1
6) History of Unilateral Weakness	1
7) History of Vertigo	-3
8) Initial Triage Diastolic Blood Pressure ≥ 110 mmHg	3
9) Dysarthria or Aphasia (History or Examination)	1
Investigations in Emergency Department:	
1) Atrial Fibrillation on Electrocardiogram	2
2) Infarction (new or old) on CT	1
3) Platelet Count $\geq 400 \times 10^9/L$	2
4) Glucose ≥ 15 mmol/L	3
Total Score (-3 to 23):	_____

National Survey of Emergency Physicians for TIA Risk Stratification Consensus and Appropriate Treatment for a Given Level of Risk

CAEP Vancouver May 2013

**The Ottawa
Hospital**

RESEARCH
INSTITUTE

**L'Hôpital
d'Ottawa**

INSTITUT DE
RECHERCHE

Objectives

- **1) Assess anticipated use of the Canadian TIA Score by the national emergency physician population**
- **2) Assess Canadian TIA Score's component face validity**
- **3) Assess risk strata for stroke ≤ 7 days**
- **4) Assess actions required for the Canadian TIA Score dependent upon level of risk for subsequent TIA**

Methods

- Mail Survey of 246 Canadian ED physicians listed in Scott's Medical Directory
- Modified Dillman Technique
 - Pre-notification
 - 3 Survey attempts
 - 1st letter included a \$10 Tim Horton's Gift Card
 - 4th attempt – registered mail

Methods

- **41 questions asked including:**
 - **Demographics**
 - **Face validity of the Score's components (4-point scale)**
 - **If physicians will use the Score (4 point scale)**
 - **Cutoffs (open percents) for low, medium, high and critical-risk**
 - **Suggested actions for each risk stratum (4-point scale)**
 - **Calculated results using descriptive statistics.**

Components of the Proposed Canadian TIA Score

Respondents rating components as “very important” or “important” were:

First TIA	80%
≥10 minutes duration	97.2%
History carotid stenosis	88.0%
Antiplatelet therapy	85.2%
Gait disturbance	76.9%
Unilateral weakness	97.2%
Vertigo (-ve predictor)	27.8%
Speech disturbance	96.2%
Diastolic BP ≥110	71.4%
Atrial fibrillation (AF) on ECG	98.2%
Infarction on CT	88.9%
Platelets ≥400x10 ⁹ /L	25.2%
Glucose ≥15mmol/L	36.1%

96.4% would use the Canadian TIA Score after validation

Degree of Risk

Using the 25th percentile (i.e. 75% of physicians would accept this degree of risk or more) defined:

Low-risk	<1%
Medium-risk	1-4.9%
High-risk	5-10%
Critical-risk	>10%

Conclusions

- **Canadian ED physicians are likely to use a validated Canadian TIA Score**
- **Most components of the Canadian TIA Score have high face validity (9/13 \geq 75%)**
- **Risk strata are defined as:**
 - **Low-risk <1%, Medium-risk 1-4.9%, High-risk 5-10%, and Critical Risk >10%**
- **Actions needed for each strata in the ED are clear and represent a combination of diagnostic tests/imaging, new medications and involvement of specialists**

BMJ. 2021 Feb 4;372:n49. doi: 10.1136/bmj.n49

Objectives

- **To prospectively validate the Canadian TIA Score in a new cohort of emergency department patients with TIA or nondisabling stroke**

Methods

Design: Prospective cohort study

Setting: 13 high volume urban Canadian EDs 2014 to 2018

Data Collection: Components of the Canadian TIA Score individually and as a whole, investigations, admissions

Outcome: Primary: Subsequent stroke or carotid revascularization within 7 days; **Secondary:** Subsequent Stroke within 7 days

Analysis: Interval likelihood ratios (iLR) with 95% CIs

Sample Size: 5,004 patients including 93 patients with stroke within 7 days

Rapid Carotid Revascularization

Stenosis	NNT in First 2 Weeks
50 – 69%	6.8
70 – 99%	3.3

Subject#: _____ **TIA STUDY - PHASE II * FAX FORM, ROT AND ECG TO -**

Inclusion criteria: Adult with ED Diagnosis of TIA or Stroke HDH KGH

Exclusion criteria: Symptoms > 1 week GCS <15 or decreased from baseline

HISTORY Is this patient eligible? Yes No

Symptoms on Arrival to ED Yes No
 First known TIA Yes No
 If not first TIA (including new event), total # in past _____, total # in past 24 hrs _____
 Date of Onset Today Yesterday < 1 week > 1 week
 Duration of Symptoms <1 minute 1-4 minutes 5-9 minutes
 10-29 minutes 30-59 minutes 60-119 minutes ≥120 minutes
 Altered Sensation Yes No If yes, Face R L Both
 Arm R L Both
 Leg R L Both
 Weakness Yes No If yes, Face R L Both
 Arm R L Both
 Leg R L Both

Language Disturbance Yes No
 Lightheaded Yes No
 Vertigo Yes No
 Confusion Yes No
 Gait Disturbance Yes No
 Visual Loss Yes No
 If yes, One Eye Both Eyes
 Syncope or Near Syncope Yes No

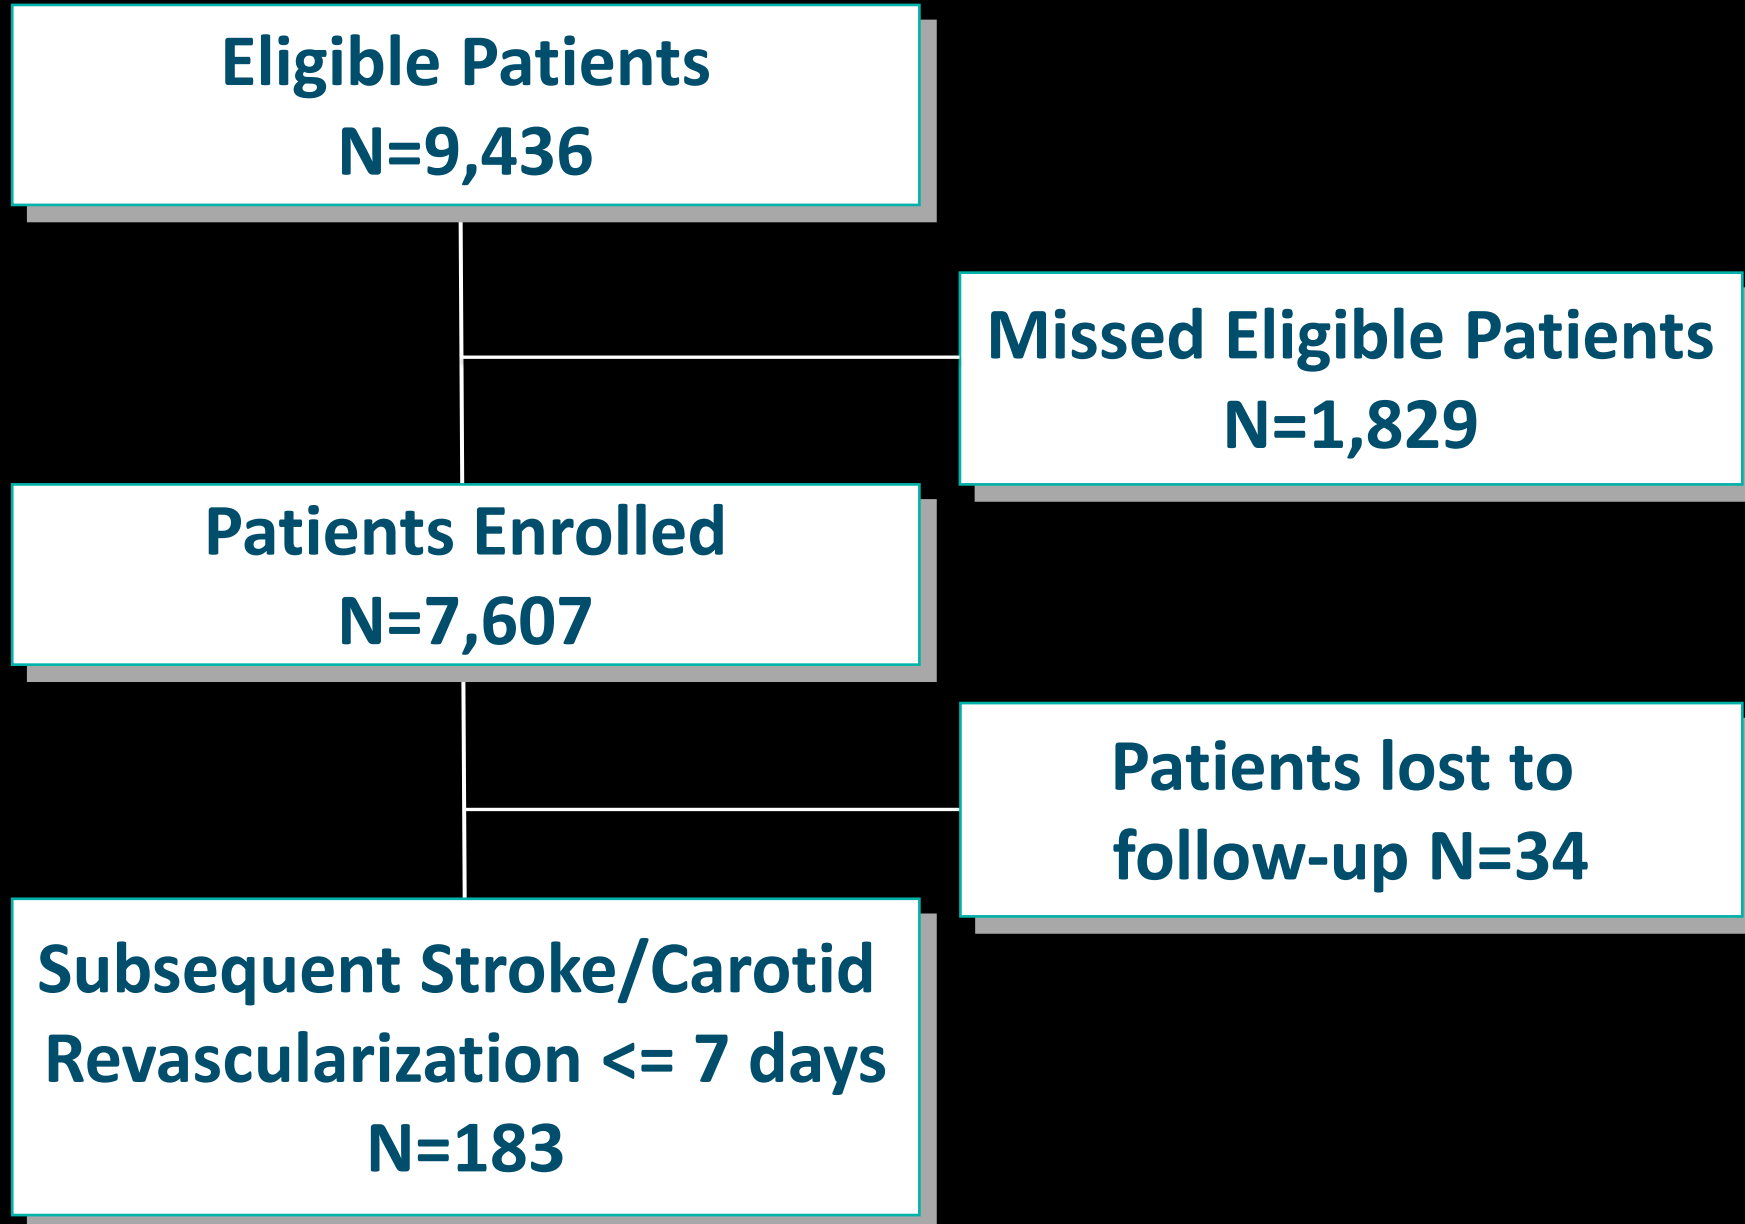

PHYSICAL EXAM Pronator Drift Yes No
 Weakness Yes No If yes Face R L Both
 Mild Moderate Complete
 Arm R L Both
 Mild Moderate Complete
 Leg R L Both
 Mild Moderate Complete
 Speech Difficulty Yes No If yes, Aphasia Dysarthria
 Altered Sensation Yes No
 Gait Abnormality Yes No
 Abnormal Finger-Nose Test Yes No If yes, R L
 Visual Field Deficit Yes No

MILD - Drift
 MODERATE - Some effort against gravity
 COMPLETE - No effort against gravity

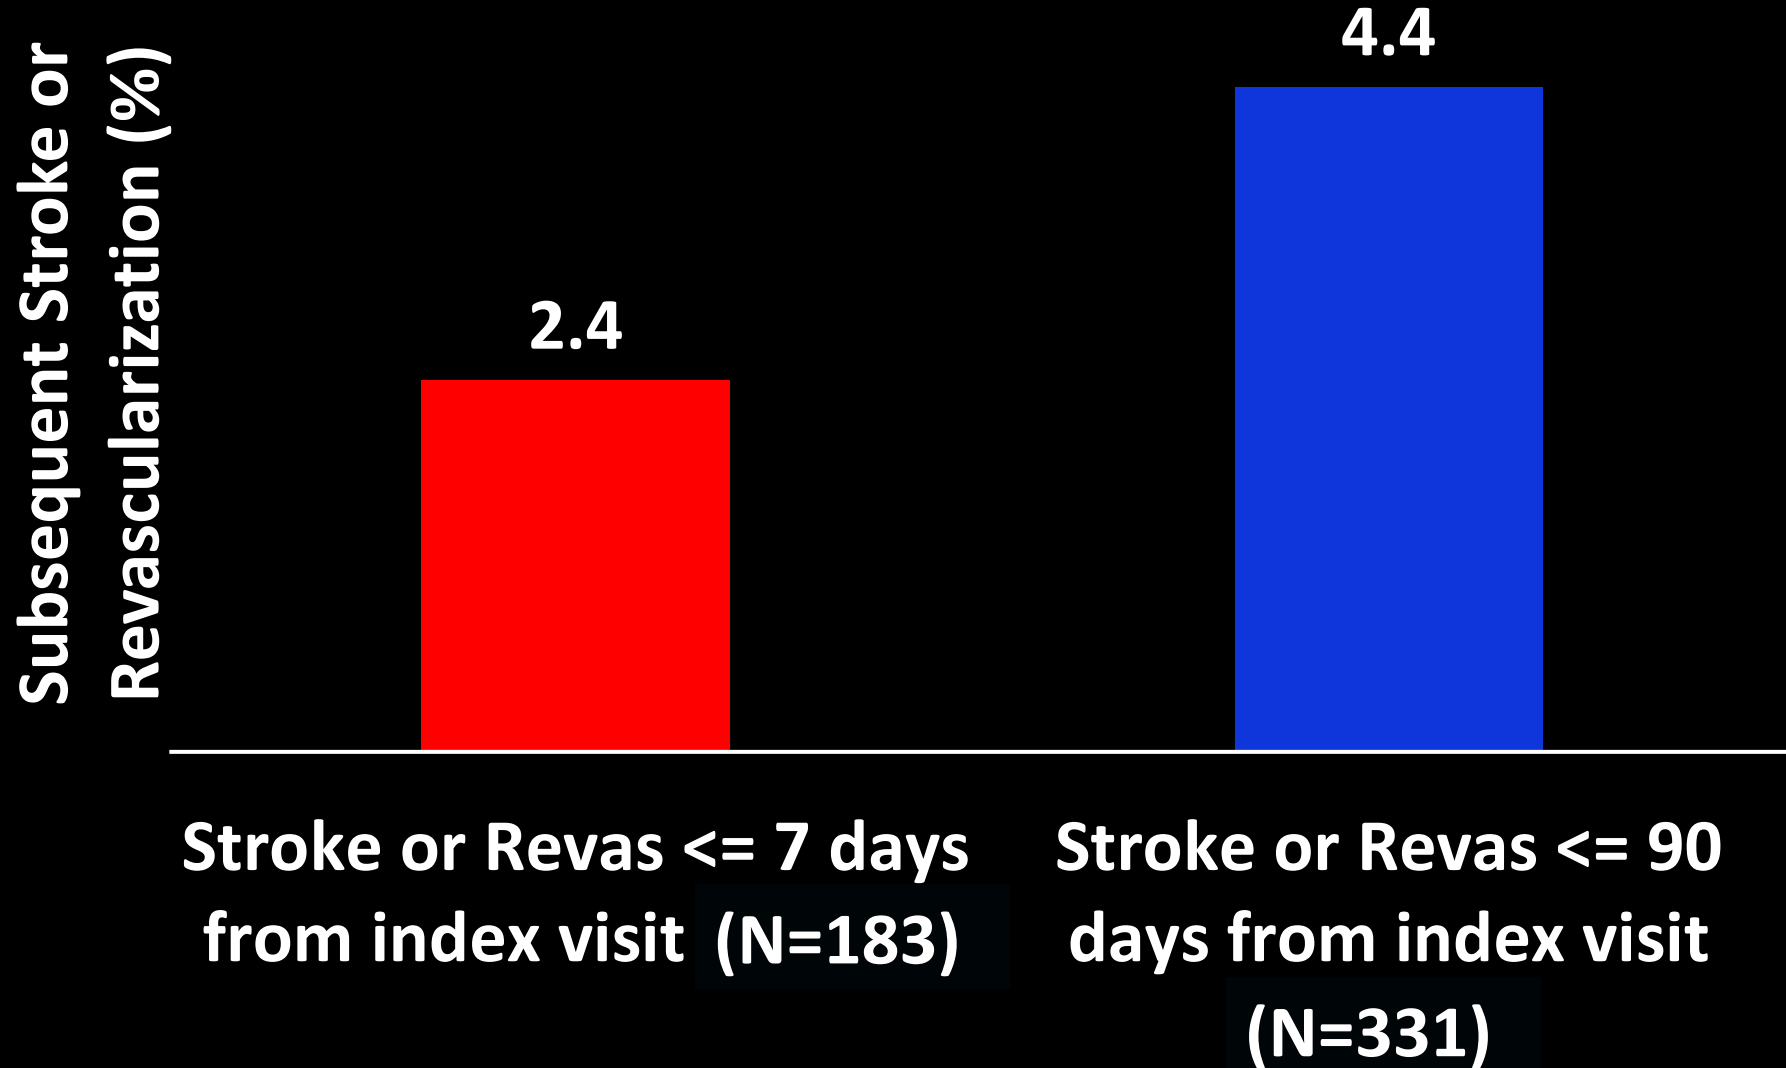

APHASIA - Loss of ability to use written/oral language
 DYSARTHRIA - Difficulty articulating

14	2	1	50.0	

Interval LRs

	Outcome		Interval likelihood ratio (95%CI)
	Yes	No	
Subsequent stroke/carotid revascularisation			
Low risk (−3 to 3)	6	1236	0.20 (0.09 to 0.44)
Medium risk (4 to 8)	124	5360	0.94 (0.85 to 1.04)
High risk (≥9)	52	829	2.56 (2.02 to 3.25)
Subsequent stroke			
Low risk (−3 to 3)	3	1239	0.17 (0.06 to 0.51)
Medium risk (4 to 8)	81	5403	1.04 (0.93 to 1.16)
High risk (≥9)	24	857	1.94 (1.36 to 2.78)

ABCD2 and ABCD2i Comparison using DeLong Method

Score or comparison	AUC (95% CI)	Difference in AUC (95% CI)	P value
Canadian TIA Score	0.70 (0.66 to 0.73)	-	-
ABCD2	0.60 (0.56 to 0.64)	-	-
ABCD2i	0.64 (0.59 to 0.68)	-	-
Canadian TIA Score v ABCD2	-	0.10 (0.05 to 0.15)	<0.001
Canadian TIA Score v ABCD2i	-	0.06 (0.01 to 0.11)	0.01

AUC=area under curve; TIA=transient ischaemic attack.

Canadian TIA score v ABCD2

Outcome

Canadian TIA score cut-offs:

-3 to 3 low risk*
4 to 8 medium risk*
≥9 high risk*

Number of outcomes 183

Correct classification 40

Incorrect classification 27

Net reclassification 13

No outcome

ABCD2 cut-offs:

No cases <1% risk*
0 to 5 medium risk*
≥6 high risk*

Number of no outcomes 7424

Correct classification 1575

Incorrect classification 678

Net reclassification 897

Additive net reclassification index = 19.2
Absolute net reclassification index = 12.0%

Outcomes

Canadian TIA score cut-offs

		Low	Medium	High	Total
ABCD2	Low	0	0	0	0
	Medium	6	103	40	149
	High	0	21	13	34
	Total	6	124	53	183

No outcomes

	Medium	1226	5021	678	6925
	High	10	339	150	499
	Total	1236	5360	828	7424

Canadian TIA score v ABCD2i

Outcome

Canadian TIA score cut-offs:

-3 to 3 low risk*

4 to 8 medium risk*

≥9 high risk*

Number of outcomes 183

Correct classification 41

Incorrect classification 21

Net reclassification 20

No outcome

ABCD2 cut-offs:

No cases <1% risk*

0 to 8 medium risk*

≥9 high risk*

Number of no outcomes 7424

Correct classification 1365

Incorrect classification 737

Net reclassification 628

Additive net reclassification index = 19.4

Absolute net reclassification index = 8.5%

Outcomes

Canadian TIA score cut-offs

		Low	Medium	High	Total
ABCD2i	Low	0	0	0	0
	Medium	6	109	41	156
	High	0	15	12	27
	Total	6	124	53	183

No outcomes

Canadian TIA score cut-offs

		Low	Medium	High	Total
ABCD2i	Low	0	0	0	0
	Medium	1233	5231	737	7201
	High	3	129	91	223
	Total	1236	5360	828	7424

Discussion

- **The Canadian TIA Score accurately identified the risk of TIA patients' risk for stroke/revascularization within 7 days**
- **The Canadian TIA Score outperformed the ABCD2 and ABCD2i Scores**
- **Individual health care systems can determine specific thresholds to make management decisions**

An example of this may be:

- **Low risk patients can be safely discharged following a careful ED assessment with routine follow-up**
- **Moderate risk patients can undergo additional testing in the ED, have antithrombotic therapy optimized and have early specialist follow-up**
- **High risk patients should be fully investigated and managed in consultation with a stroke specialist during their index ED visit**

Limitations

- **As this was an observational study there was some variation between physicians and centers regarding testing and management**
- **We did not adjudicate if the side of the carotid stenosis with an intervention correlated with the symptoms**
- **We have not yet completed the refinement step – in which we will try to assess if a more sensitive or specific model is feasible**
- **Unlike other emergency conditions, the Canadian TIA Score will not give a 100% sensitive model, which directs care, but rather one which identifies high, medium and low risk patient groups**

Conclusions

- **The Canadian TIA Score identifies the risk of TIA patients for subsequent stroke or carotid artery revascularization within 7 days**
- **It is anticipated that using the Canadian TIA Score will optimize resources to improve decisions on hospitalization, investigations and prioritization for specialist consultation**
